DETAILED ACTION

I. EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.
2. Authorization for this examiner's amendment was given in a telephone interview with Mr. Jeffrey K. Weaver (Reg. No. 31,314) on August 3, 2010. The examiner proposed amendments to better place the application in condition for allowance, particularly adding the limitation that prior arts fail to teach. Mr. Weaver agreed.

The application has been amended as follows:

3. **Claim 1** (Currently Amended) A switch comprising:

a port configured to receive a write command frame, the frame having a header comprising an originator exchange identifier (OX_ID) field and a receiver exchange identifier (RX_ID) field, as well as a Host identifier field and a target identifier field, wherein the Host and the target identifier fields identify Host and target devices, and wherein the ~~OX_ID~~ and the ~~RX_ID~~ exchange identifier fields enable the Host and the target to keep track of various transactions between each other;

a trapping mechanism configured to trap the write command frame; and

a processor configured to process the trapped write command frame by modifying the OX_ID field of the write command frame header to include a new value of an OX_ID exchange identifier before sending the write command frame to the target;

wherein the processor is further configured to generate a transfer ready command frame, initialize a receiver exchange identifier (RX_ID) of the transfer ready command frame by assigning a value to the RX_ID field, the assigned RX_ID corresponding to a write command session,

send the transfer ready command frame to the initiating Host before receiving a transfer ready command frame from the target;

receive a command frame with the assigned RX_ID value; and

use the RX_ID value as a handle for accessing information pertaining to the write command session in a sessions table, the sessions table storing information about one or more sessions or exchanges.

4. **Claim 2** (Previously Presented) The switch of claim 1, wherein the switch is an initiating Switch coupled to the Host in a first SAN.

18. **Claim 17** (Currently Amended) The switch of claim 1, wherein the switch is further configured to use the RX_ID value of trapped write commands to specify the amount of buffer space needed for the write command and use the write command frame to request the needed buffer space.

19. **Claim 18** (Currently Amended) The switch of claim 17, wherein the switch is further configured to use the RX_ID value of trapped write commands to specify the amount of buffer space larger than needed for the write command and use the additional buffer space for subsequent write commands so that the ~~switch apparatus~~ need not wait for a Transfer Ready command to transfer data related to the subsequent write command.
20. **Claim 19** (Previously Presented) The switch of claim 1, wherein the switch is further configured to, in the event the switch does not have sufficient buffer space for the write command, to either: (i) generate a busy status signal to the initiating Host; (ii) place the write command on a pending wait list; or (iii) forward the write command to the target.
21. **Claim 20** (Previously Presented) The switch of claim 1, further comprising: a first SAN including the switch; a second SAN; and an inter-SAN network connecting the first SAN and the second SAN.
22. **Claims 21-23** (Cancelled)
23. **Claim 24** (Currently Amended) A method comprising:
receiving a write command at a switch, the write command specifying a host identifier corresponding to a host device and a target identifier corresponding to a target device, the write command also including an originator exchange identifier (OX_ID) field with an assigned value and an uninitialized receiver exchange identifier (RX_ID) field with a default value, wherein the

OX_ID~~OX_ID~~ and the RX_ID~~RX_ID~~ fields enable the host and the target to keep track of various transactions between each other;

generating a transfer ready command at the switch;

initializing a receiver exchange identifier (RX_ID) of the transfer ready command by assigning a value to the RX_ID field, the assigned RX_ID value corresponding to a write command session;

sending a transfer ready command including the initialized RX_ID to the host prior to receiving a transfer ready command from the target, wherein sending the transfer ready command to the host allows the switch to operate as a proxy for the target;

modifying the originator exchange identifier (OX_ID) of the write command to generate a modified write command;

forwarding the modified write command to the target;

receiving a command with the assigned RX_ID value; and

using the RX_ID value as a handle for accessing information pertaining to the write command session in a sessions table, the sessions table storing information about one or more sessions or exchanges.

24. **Claim 25** (Previously Presented) The method of claim 24, further comprising configuring the switch to forward data frames associated with the write command received in response to the transfer ready command to the target.

25. **Claim 26** (Previously Presented) The method of claim 25, wherein a second switch between the switch and the target receives data frames associated with the write command and buffers the data frames until a transfer ready command is received from the target.

26. **Claim 27** (Currently Amended) An apparatus comprising:

means for receiving a write command at a switch, the write command specifying a host identifier corresponding to a host device and a target identifier corresponding to a target device, the write command also including an originator exchange identifier (OX_ID) field with an assigned value and an uninitialized receiver exchange identifier (RX_ID) field with a default value, wherein the OX_ID~~OX_ID~~ and the RX_ID~~RX_ID~~ exchange identifier fields enable the host and the target to keep track of various transactions between each other;
